## \\"Chaining\\" Order Forms to Achieve Upsell

Posted by jamesburchill - 2009/07/02 12:29

---

I know that upsells are easy enough to achieve in the shopping cart... but for this client solution I'm not using the cart in this one instance.

I know I can create another order form and use its URL in the thankyou URL of the former (thereby chaining them together)

But... and this is the biggy, can I access any of those variables it passes along and use them to pre-populate that linked order form?

I don't want to annoy the client by having them redo all the basic order info...

Thanks in advance for any insights.

James :S

James,

I would suggest using a web form and hide firstname,last name,email and put a snippet of code (email me if you want the php or script version) to pre populate the hidden fields. Then on the web form also have a checkbox that's pre checked with an action to create an order (the upsell product) and charge the most resent card on file(the one they just used in order form).

So basically,

Create a upsel sales page that they go to from order form with only a pre checked check box and a submit button. All the other info is a pre populated hidden field.

Hope this help.

Steve

I'm exploring all options Steve so yes thank-you, I'd like the snippet of code. Email me cmac (at) jamesburchill (dot) com

Cheers!

James
