## Web Form Information

Posted by Bregazzi - 2009/07/03 07:35

---

Hi,

I'm new to Infusion soft and have just created my first form and put this on the site. However the form is to collect email addresses to a free product.

All's well it works - however it works if I just put 1 letter in the name box and 1 letter in the email box. There seems to be no security. If the email address is required if someone doesn't put an email address in there surely the coding should not allow it to go through, otherwise my data base might get full of rubbish?

Is there something that's missing?

Your not missing anything. Infusionsoft doesn't perform validation on those fields. You'd need to add in some of your own javascript to validate the form.

Here is a how to on adding that javascript to your form. It's a little painful but it's what I use every time I'm asked to do that...

[http://www.w3schools.com/jS/js\\_form\\_validation.asp](http://www.w3schools.com/jS/js_form_validation.asp)

This validation has nothing to do with Infusionsoft but if you set it up right, it should check your form before it's ever submitted to Infusionsoft keeping your data clean.

Cheers!
